

Inheritance

- the base (derived/base) class is the parent (parent/child)
- the derived (derived/base) class is the child (parent/child)
- a child (parent/child) has an is-a relationship with the parent (parent/child)

(More) Concretely

- the Animal class is the base
- the Reptile class is the drived
- a reptile is a(n) animal

What is not inherited?

animal.sound_

What is inherited?

MakeSound()

How does privacy interact with inheritance?

child follow the access
permission as its parent

Animal

```
class Animal {
public:
    Animal(string sound): sound_(sound) {}
    string MakeSound() {return sound_; }
    virtual int GetPower() {return 0; }
private:
    std::string sound_;
}
```

Reptile

```
class Reptile : public Animal {
public:
    Reptile(std::string sound):
        Animal(sound + "rawr") {}

    int GetPower() {return 2; }
}
```

Mammal

```
class Mammal : public Animal {
public:
    Mammal():
        Animal("fuzzy fuzz") {}
    int GetPower() {return 3; }
}
```

Turtle

```
class Turtle : public Reptile {
public:
    Turtle(): Reptile("turtle turtle") {}
    int GetPower() {return 7; }
}
```

```
// We could instantiate some Animals as follows:
Turtle t;
Mammal gopher;
Animal *cow = new Animal("moo");

std::cout << t.MakeSound() << std::endl;
std::cout << gopher.MakeSound() << std::endl;
std::cout << cow->MakeSound() << std::endl;
```

What is the output of the above code?

turtle turtlerawr
fuzzy fuzz
moo

Would the below code work? why/why not?

```
std::vector<Animal> vec = {t, gopher, *(cow)};
```

1 no,

Dynamic Dispatch

What is dynamic dispatch? How does it relate to the `virtual` keyword?

dynamic dispatch will choose the desired functions to run during runtime

virtual allow child to override the function from parent

```
// Now, let's instantiate some more objects as follows:
Animal * t2 = new Turtle();
Animal * m2 = new Mammal();
Animal * r2 = new Reptile("hiss");
```

Would the below code work? why/why not?

```
std::vector<Animal *> vec = {t2, m2, r2};
```

Answer:

no

What method(s) are called in the following code?

```
// which method is being called for these function calls?
for (int i = 0; i < vec.size(); i++) {
    std::cout << vec[i]->MakeSound() << std::endl;
}
```

method(s) called

animal.MakeSound

What method(s) are called in the following code?

```
// which method is being called for these function calls?
for (int i = 0; i < vec.size(); i++) {
    std::cout << vec[i]->GetPower() << std::endl;
}
```

method(s) called

turtle.GetPower
Mammal.GetPower
Reptile.GetPower

What would happen if `GetPower()` had not been marked `virtual`?
